Infantile bilateral striatal necrosis

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. [Infantile bilateral striatal necrosis](#). ORPHA:1576*

Infantile bilateral striatal necrosis (IBSN) comprises several syndromes of bilateral symmetric spongy degeneration of the caudate nucleus, putamen and globus pallidus characterized by developmental regression, choreoathetosis and dystonia progressing to spastic quadriplegia. IBSN can be familial or sporadic (see these terms).
