INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. [Ligneous conjunctivitis](#). ORPHA:97231

Ligneous conjunctivitis (LC) is a rare form of chronic conjunctivitis characterised by the recurrent formation of pseudomembranous lesions most commonly on the palpebral surfaces. It is most frequently reported as a clinical manifestation of severe homozygous or compound-heterozygous hypoplasminogenemia (see this term).
