Potential competing interests: No potential competing interests to declare.

The article has been notably improved compared to its previous version in the aspects of language skills and in the depth of discussing the awareness of per- and polyfluoroalkyl exposure. The data arrangement and discussion section gained more decency as well, which captured the situations of government organizations and local regions.

While acknowledging the improved quality of the current version, doubts can still be cast on the profoundness of the meaning of this topic. The authors urge to increase the awareness of the mentioned hazardous exposure, but such an objective can be considered as inferior to actually attempting to solve the problem via a scientific approach. The current version lies in a position too sufficient to be a press article, but moderately or might not be sufficient to be published in a scientific research journal.
