Potential competing interests: No potential competing interests to declare.

The present article deals with the overnutrition problem among married and cohabiting women in Nigeria based on national-level DHS data. The overall presentation of the results was good but some points need to be addressed as-

1. Clarify the socio-ecological model of overnutrition/obesity. put one diagram in the introduction.
2. What is the limitation of the study in the context of the socio-ecological model?
3. Categorization of dependent variable should be done Overnutrition vs normal and exclude the underweight individuals
4. Try to find out the most significant predictor by using step-wise logistic regression analysis at the end to see the independent variables at individual, interpersonal and community level
5. If possible, if the author finds some linkages, then use path analysis to order put some more appropriate population-specific model of the study
