Review of evaluation of the impact of the COVID-19 pandemic on nurses

1. Introduction need to be focused on the rationale of the study
2. This study is aimed to investigate the effects of the COVID-19 pandemic on the professional activities and lives of nurses, as well as their compliance with infection control measures during their health care services. But assessed only compliance with infection, professional activities and lives of nurses not measured
3. professional activities and lives of nurses need operationalization
4. Description of measures are not written
5. What tools or scales are used, are they standardized scales?
6. what scale was used to measure the professional activities
7. what scale was used to measure the lives of nurses.... all these are not clear
8. Simple description of information....interpretation and finding the new knowledge not evident
9. How sample selected?
10. what is the sample size? How sample size is calculated? these need to be added in the methods
11. Results are explained only with frequency and percentage....not used other inferential statistics
12. Not mentioned about limitations and recommendation of the study
13. In conclusion it is mentioned that Nurses who were afraid of death due to COVID-19 needed more psychological support in proportion to the severity of their symptoms, how this inference is drawn?
14. No valid and reliable tools are used to measure the variable
15. Conclusion is not related to aim of the study
