Dear authors,

Thanks for your work.

The following remarks are to be noted:

- 1- In the title & abstract, it is mentioned that the patient underwent mastectomy, while in the case presentation, it is reported that the patient had bone metastasis and mastectomy was not reported.
- 2- The site of carcinoma, Erysipeloides, is not described in the case presentation.
- 3- The treatment regimens received by the patient are not mentioned.
- 4- The definition of Carcinoma Erysipeloides (second paragraph in the case presentation) should be deleted from the case presentation and moved to the introduction or discussion.
- 5- The IHC pattern to prove that the lesions are metastatic of breast origin is not mentioned.
- 6- The follow-up & management of the case is missing.
