

Review of: "The Imperative of a Comprehensive One Health Approach for Mosquito-Borne Disease Control in Indonesia"

Mahmud Ahmednur Mohammed

Potential competing interests: No potential competing interests to declare.

I have enjoyed reading this nice work. Really, it will benefit societal problem resolution efforts in the area. However, generally, I found it a bit general, and I have some general points as highlighted below.

-Which is right to use, 'one health,' 'One Health,' or 'one health'? Because all three forms are there in this document.

1. Interconnectedness of Human, Animal, and Environmental Health

-I think it is more possible to make the review detailed. For instance, the impact of human-environment interaction on mosquito-borne disease control or eradication programs. Similarly, the effect of overlooking animal health on the programmes by supporting with some research evidence (maybe specific to the diseases).

-On the other hand, it would have been nice if the major mosquito groups could be characterized in terms of their geographical distribution, habitat preference, and the change in trends due to humans' environmentally unfriendly activities. And the change in global distribution of respective diseases. For example, Dengue fever, which was previously limited to some tropical and sub-tropical regions, is now becoming a global threat.

2. Cross-sector collaboration and policy implementation

-This section is one of the important sections in this review. However, I wonder if the author can show more on the role of each sector or stakeholders (directly or indirectly for the control of the diseases) and on how to make collaboration to make it imperative and clear. For instance, what would be the role of agricultural sectors?
