Potential competing interests: No potential competing interests to declare.

I congratulate the research team on the chosen topic, especially considering that Artificial Intelligence (AI) is gaining global significance. Furthermore, the topics related to ethical governance and responsibility, identified by the authors, generate significant multiplier effects. In this regard, I suggest that the authors highlight the innovative scientific contributions to the specialized literature, as well as the broader impacts of the study's results. The results are effectively presented, both descriptively and graphically, through figures and tables, with a clear emphasis on the statement: "The proposed framework provides a structure for assessing the ethical implications of AI applications."

In the conclusions section, I suggest that the authors also address the study's limitations and align these with the future research directions mentioned in the paper.

Once again, I congratulate the research team on this study, especially in the context of the digital age, where Artificial Intelligence (AI) represents a key priority across all fields of activity, particularly within the academic domain.
