Review of the article:

Before the manuscript can be recommended for publication, the authors need to significantly revise their manuscript by taking into account the following comments:

1. The study lacks validation with previous experimental and numerical data available in the literature.
2. Nomenclature should be included in the report.
3. The novelty of the paper needs to be justified and clearly defined.
4. Model description is very weak, and a detailed explanation should be given with dimensions.
5. Figures 1 and 2 are not clear and without any dimensions.
6. Results and discussion section must be improved.
7. Need to provide temperature contours.
