

Review of: "Precipitation and Temperature Trends over the Lake Tana Basin, Ethiopia"

Sabrina Taibi

Potential competing interests: No potential competing interests to declare.

General comment: the authors presented a review of relevant studies conducted on past and future variability of precipitation and temperature in the lake of tana Basin. I find that the idea is good but needs to be supplemented with more details, particularly about the origine of observed and projected data in the different studies , and statistical methods used. Also, authors have to explain the discrepancies between some results about historical and projected variability.

to complete this review, it is interressant to present the impact of precipitation and temperature variability on hydrology, water resources and agriculture in the study area.
