Potential competing interests: No potential competing interests to declare.

In the manuscript, authors evaluate the value of NLR as a potential biomarker for results of the treatment in breast cancer. In the introductory part, authors should also mention the value of NLR in postoperative follow-up in digestive surgery (predictor of anastomotic fistula, with relevant references).

Authors should check again the tables for errors.

Authors should mention the limitations of their study.

The conclusions should be more concised, and should only mention the results obtained in the study. In my opinion, the generalities should be eliminated.
