This paper is a good overview. The title is suitable for the content. A general summary of coating technologies for titanium implants. Unfortunately, the author givesn't have any examples of the application of the listed coatings. The article develops a significant number of references in a readable and logical structure. What is missing for me is a summary in which the author could describe his own opinion on the technologies listed, based on his experience or the literature. In conclusion, the article is a valuable and informative piece of work.
