

Review of: "Enhancing Soil Stabilization in Soft Soils Through The Addition of Sand to Soil-Cement Piles: a Comprehensive Study"

Hossein Ghorbani Dolama

Potential competing interests: No potential competing interests to declare.

An interesting topic has been investigated, but it has many weaknesses as follows, which should be addressed:

- 1- The title does not match the content.
- 2- In the scientific article, the problems should be expressed in a way that does not have a classroom teaching mode.
- 3- Use the full form for the first time and the abbreviation for subsequent times.
- 4- There is no connection between the paragraphs.
- 5- Needs to be reviewed by a native.
- 6- Formulas should be expressed in standard form.
- 7- There are many broken contents.
- 8- The results should be stated at the end in the Conclusion.
- 9- Characteristics of soil, cement, and additives should be stated completely.
- 10- The specifications of tests, sampling, and relevant standards should be stated.
- 11- Figure 1 is related to another test that should be replaced with the relevant instrument.
- 12- Curing, environmental conditions, and related issues should be stated.
- 13- References should be expressed in a standard way.
- 14- The results should be expressed graphically and comparatively.
- 15- Recent research should be used in the references.
- 16- Technical sentences and words should be used.
- 17- Add more images of additives, examples, locations, and implementation steps.
