## Comments:

1. The abstract should be corrected and more closely related to the results presented in the tables.
2. The tables present four "Species" or "Crop", i.e., "Lotus seed, River spinach, Spine-gourd, Water chestnut", while the Introduction section lacks the characteristics of this raw material.
3. The discussion of the results presented in the tables should be longer and properly discussed. It should not only concern the content of polyphenols, which influence the antioxidant activity of herbs and spices, but also the antibacterial activity, with an indication of the compounds that determine it.
