Building Foods Data Automation Platform Using Cloud Computing Type PaaS

The paper causes interest; however, I have some comments:

What is the main objective?

¿In the Introduction, does the concept as it arises?

The concept of PaaS is not clear.

What would be the characteristics of the central server to manage the whole process and keep it updated and up to date?

The methodology is somewhat repetitive and does not express in a clear and concrete way how the implementation of PaaS is done, where, in which companies, if all of them will be service providers or distributors.

Maybe a flowchart or figure would help in the explanation of how they plan to implement the PaaS.

An important point: who will be the customers?

The communication would NOT be through the internet?

Only in the initial paragraph of the results was the objective expressed; perhaps placing it in the introduction would help the reader to understand the reason for the work.

Why only data? Where or for what purpose do you use the data presented?

3.2 Migration of data? Why be migrating?

The instructions placed at the end of the paragraphs of section 3 seem to be copied from a manual other than the one you present because they suddenly do not make sense with the reading.

The work is of interest. I recommend that you read it and make your work clear.
