Potential competing interests: No potential competing interests to declare.

This concise analysis reveals tobacco smoking's dire consequences in Kenya, particularly highlighting lung cancer among other serious conditions. The research, spanning 2012 to 2021, associates 60,228 deaths with smoking, emphasizing the disease's burden on those over 35. With a significant male smoking prevalence, the study calls for urgent, targeted tobacco control to address this public health crisis effectively.
