Inform about emotional consequences BCT

Behaviour Change Intervention Ontology (BCIO)

Source

[Behaviour Change Intervention Ontology \(BCIO\)](#)

Definition: An increase awareness of consequences BCT that provides information about the emotional consequences of performing or not performing the behaviour.

Comment: Consequences can be for any target, not just the recipient(s) of the intervention; emphasising importance of consequences is not sufficient. Consequences can be related to emotional health disorders (e.g. depression, anxiety) and/or states of mind (e.g. low mood, stress).

This definition was imported from the Behaviour Change Intervention Ontology (see <https://bciosearch.org/>). Comments and suggestions for improvements are welcome using the Qeios review system.

Definitions imported from the Behaviour Change Intervention Ontology (BCIO) are what are known as 'ontological definitions'. See this article in Qeios for an explanation <https://www.qeios.com/read/YGIF9B>.

Ontological definitions can sometimes be hard to read. In those cases we also include an informal definition.

Definitions also often require elaboration to make it clear how they should be used and what they include. In those cases we include a comment.

Also, definitions sometimes require an explanation as to how they came about to help users understand how they relate to alternative definitions. In those cases we include a curator note.
