Review of: "Development of Body Fat Estimation Equations Based on BMI, Age, Gender, and Ethnic Groups"

Asaad Babker¹

1. Gulf Medical University, United Arab Emirates

Suggestions for Improvement:

1. Break down age groups into finer categories (e.g., children, adolescents, adults, seniors) to determine how age influences body fat and tailor equations accordingly.
2. Collect data on participants' physical activity levels, which can be included as a variable to improve the predictive accuracy of the BF equations.
