The manuscript submitted for review concerns the evaluation of antimicrobial properties of extracts from selected plants.

The manuscript has a typical experimental layout and character, but contains a number of errors which, in the opinion of the reviewer at this stage and in this form, make the study unsuitable for publication.

1. the authors did not provide chemical characterisation of the preparations obtained by the archaic method. This basically prevents a meaningful discussion of the results with studies by other authors, as there is no explanation of e.g. the mechanism of action.
- 2) Couldn't the ethanol residue, even in low concentrations, have a significant bactericidal or inhibitory effect? Where are the positive and negative controls?
- 3) Why were the antimicrobial properties determined with such a vague method and not confronted with the MIC value?

The work is insertable but contains many serious errors and is not suitable for publication in this form.
