Potential competing interests: No potential competing interests to declare.

The manuscript, "Cytobiological Alterations Induced by Celecoxib as an Anticancer Agent for Breast and Metastatic Breast Cancer," describes the development, progression, and metastasis mechanisms of breast cancer, as well as the potential therapeutic role of celecoxib, a selective COX-2 inhibitor that is able to modulate angiogenesis, immune response, and matrix metalloproteinase activity, which are pivotal in metastasis. The manuscript is well written, and the illustrations are well depicted. I just have some minor modifications to suggest in the general structure of the manuscript:

Section 3, Mechanism of Action: This section could be modified to introduce in a general way the chemotherapeutics in breast cancer, then address the section to celecoxib. Then, the title of this section could be modified to Chemotherapeutics in Breast Cancer.

In addition, authors should improve the resolution of images (dpi).
