Potential competing interests: No potential competing interests to declare.

It is seen that the design of the research is more suitable for the mixed method design, which is the embedded experimental design. In this context, I suggest that the model be revised.

The original validity and reliability values of the data collection tools used in the research should be added. In addition, it is recommended to include the Croanbach alpha reliability values calculated in the study.

Normality test results are related to the preparation of the data for analysis. In this context, it should not be included in the findings section.

It is recommended to add effect size coefficients (Cohens d) for values that show significant differences in the t-test tables. These values will contribute to the quality of the study.

The limitations of the research should be stated more clearly before making recommendations.

It is a study that contributes to the field. Congratulations to the authors.
