Extremely interesting topic that needs some more investigation and a more comprehensive presentation. The examination of the decalogue needs, in my opinion, a clearer framework. Is the decalogue resulting from algorithmic calculations? What kind of data has been used in formulating the decalogue? As a closed system, the Decalogue attains to its logic. What I find stimulating is not the Decalogue by itself, but the premises that have been used in order to make AI able to develop this Decalogue. Reading it, it is for sure based on western rational thinking, and therefore the result cannot deviate from that kind of premises.
