Potential competing interests: No potential competing interests to declare.

This manuscript focuses on the travel route planning problem, proposes a greedy-based solution, and conducts experimental studies. Although the paper targets an interesting problem and there are some nice illustrations, there are still some issues regarding novelty, evaluation, and presentation:

1. The introduction is too brief. I suggest adding more in-depth discussions on state-of-the-art solutions to the travel route planning problem, since this problem is not new. Besides, the technical contribution should also be highlighted.
2. The paper lacks a clear problem formulation, which could help readers understand the technical challenges.
3. The proposed methods are not entirely novel, and they are more likely to be applications of existing techniques. Perhaps more optimizations could be considered.
4. The evaluation involves limited baselines.
5. The presentation requires further improvements.
