The abstract needs to be revised because it should show the need of the study and the technical contribution of the work, which is missing here. In the abstract, deep learning can be abbreviated as DL and then used as DL in the rest of the abstract. Furthermore, avoid the "we have" statement.

What is the new thing the authors want to explore or propose, as this pose estimation or behavior-based people detection has been studied/researched extensively? Another thing is that benchmarking of results with different types of YOLO (versions) would clearly show the performance.

What kind of dataset has been used? Missing references.
