Potential competing interests: No potential competing interests to declare.

It is a well-written and well-organized report, despite the following suggestions for improvement:

1. There is a lack of details on the diagnosis of prednisolone-induced gingival hyperplasia that needs to be addressed.
2. Keywords are well-covered.
3. On page 2, line 11, the text (lower front and back teeth region for 6 years) should be paraphrased as (lower anterior and posterior teeth region for 6 years).
4. In the discussion chapter, paragraphs 2 and 3 lack references, which are mandatory.
