Open-Source Remote Sensing Determination of Carbon Emissions From Tropical Deforestation Scenarios in Southeast Nigeria

Qeios ID: JZ21C6

Reviewer comment

- Manuscript writing good but many mistakes and correct question mark comments.
- Introduction good.
- In the sampling method, mentioned some major species which are found. You measure only diameter or girth, not height, volume, biomass, etc., then convert into carbon sequestration.
- Material and method very weak. Add methodology on how to net area convert in quantity of CQ and calculate carbon emission and sequestration.
- Results and discussion, describe data very shortly and not scientific data table or fig., and in discussion not elaborate according to your results.
- Conclusion is ok.
- Study area fig. good.
- In the references part, carefully check it.
