An interesting, well-written article with very good development points out the history of man's domestication of plants and animals over time. However, when the author mentions the changes in species as they become domesticated, they no longer return to the wild state. One point that could be discussed is that several species return to their feral form when they are forgotten or dispersed in other places and adapt quickly, such as the large number of mammal species that returned to their wild stage in Australia.

Another point that could be considered is the domestic breeds of Asian buffaloes that could be discussed in the context of the article.

Please consider *Oryza sativa* and not *Oryza saliva*.
