Review of: "L4-L5 Anatomy Classification System for Lateral Lumbar Interbody Fusion"

Liang Chen[1]

1 Chongqing University

1 The article mentions the evaluation and classification of images by three experts, but lacks statistical analysis of the results of the assessments by these three experts. Is there a statistical difference in the assessments among the various experts?

2 The evaluation of images involves supine position MRI images, and the article mentions that the lateral and supine positions can affect the position of the lumbar erector spinae to some extent. Can lateral position MRI images be included to further assess lateral LLIF?
