Dominant hypophosphatemia with nephrolithiasis or osteoporosis

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Dominant hypophosphatemia with nephrolithiasis or osteoporosis. ORPHA:244305*

Dominant hypophosphatemia with nephrolithiasis or osteoporosis is a rare, genetic, renal tubular disease characterized by hypophosphatemia, decreased renal phosphate resorption and hypercalciuria leading to calcium nephrolithiasis and/or nephrocalcinosis and osteoporosis, in the presence of normal/increased serum calcitriol levels.
