Review Comments

The subject matter of this paper is of the utmost importance and has the potential to expand upon current knowledge. It examines the evolution of public administration from its traditional form to its recent convergence with technological advancements. This article posits that an enhanced administration of public education that incorporates the latest technological advancements could potentially prolong human "lives." Nevertheless, there are specific ambiguities that diminish the overall rigour of this subject's presentation. Firstly, the use of the terms "humankind" and "humanity" is excessively philosophical, whereas public administration is primarily concerned with technical business that contributes to the improvement of citizen services. Consequently, technical terms such as citizen, public, or comparable ones are preferred. Additionally, the introduction of the paper is excessively lengthy and contains instances of repetition. It is advisable to keep it brief and incorporate concepts from the existing body of literature. Furthermore, this paper discusses the pivotal role that information technology plays in the current era, necessitating the public administration's adoption of said technology. Therefore, it would be more effective to relate this background to how innovations in technology could contribute to the enhancement of public administration services.

Furthermore, the findings are devoid of analyses and merely provide a synopsis of key points. Therefore, in-depth analyses are necessary to ensure its rigour. Finally, the conclusion of the paper serves as a bland recapitulation of the preceding material without providing a definitive response to the main argument or the purpose of the paper.
