

Review of: "A Bibliometric Review of CSR in China Based on CNKI Database: 2006-2022"

Ye Wu

Potential competing interests: No potential competing interests to declare.

This is an interesting manuscript that focuses on the evolutionary vein of CSR research papers. However, I believe that the research process, textual expression and logical presentation of the manuscript need to be significantly revised.

1. In the Introduction The manuscript shows "In the middle of the twentieth century, High level of international concern for the environment, the economic society gradually linked CSR with business trade. The implementation of CSR strategy by enterprises became one of the important initiatives to enhance their international competitiveness."

Suggestions: I suggest the authors try their best to sort out the evolution of CSR theory and explain the internal logical mechanism of its evolution.

2. In the Introduction It is necessary to highly refine and accurately point out the current research status of CSR in international academia, and then analyze the research perspective and national characteristics of Chinese academia on this issue, so as to draw out the research significance and innovation points of the manuscript.

3. In the Data and Methodology It is necessary to do a descriptive analysis of the source journals of the selected papers, either as graphs or tables. At the same time, the hierarchical nature of journals needs to be pointed out.

4. In the Trend analysis of the number of articles issued Pure quantitative statistics cannot strengthen the understanding of CSR research; Instead, it needs to be analyzed from a multi-dimensional perspective such as the number of papers, journal level, paper impact factor, and even author influence.

5. In the Keyword frequency analysis

The manuscript shows "The existing research shows that scholars have paid attention to both environmental factors and other antecedent factors that influence CSR performance, and there is a trend for CSR research to be multi-faceted and wide-ranging." However, due to the lack of literature support, references need to be supplemented.

6. In the Keywords clustering Analysis. There is too little content in the text, so it is necessary to carefully analyze Figure 2 and make in-depth and specific descriptions based on relevant literature.

7. It is necessary to carefully analyze Figure 3 and make in-depth and specific descriptions based on relevant literature.

8. In the Keyword Trend Analysis. It is suggested that the author sort out the correlation between different clusters and explain it with appropriate logic.

9. It is suggested that the author make in-depth modifications according to the above opinions and then optimize the conclusions; The future research direction also needs to be further optimized, especially from the existing literature, rather than just the expression of personal opinions.
