In my opinion, the theme of the paper is interesting. However, the author has omitted certain details, which are provided in the following points:

Abstract:

- The abbreviations ECO-CSV and ECO-CSSB should be clarified to highlight the nature of the additives involved.

Introduction:

- The authors should augment the study with relevant literature data that demonstrate the necessity for this type of research.

Material and Methods:

- In this section, the authors should provide a clear description of the experiment and specify the standard methods applied, as this information is currently lacking in the paper.

Results:

- In order to better understand the obtained results, this section should also contain the general characteristics of soil, cement, and additives.
