Review of: "Statistical Overview of Prevalence of Anaemia with Associated Socioeconomic and Demographic Factors in Nigeria"

Aymeric Darboux

Potential competing interests: No potential competing interests to declare.

My suggestions are the following:

- you can reduce the length of the introduction by resuming in one paragraph the previous studies findings
- Details on what is logistic regression, why or how to use it, the formula, and the assumptions of the model are not compulsory
- Same suggestion for chi-square
- The paper should be organised in Abstract, Introduction, Methods (Source of data, Variables and their measurement, Data treatment and analysis, Ethics consideration), Results, Discussion, Conclusion, References
- In Methods (Data treatment and analysis), it should be explained how raw data have been processed and how the analysis through the chi-square and logistic regression has been done (construction of the first model, elimination of non-associated variables, obtention of the final model, assessment of the model adequacy)

Thanks for the opportunity to review this paper.
