The manuscript entitled " Medical students' disease status of COVID-19: A multicenter study " aims to evaluate the COVID-19 infection status amongst undergraduate medical students of the KP province of Pakistan and to determine the relative risk of COVID-19 between preclinical and clinical years. Here are significant concerns as outlined for the authors to consider below.

- Recommended to change the article title
- Introduction restructuring and shortening recommended
- Methodology section should be detailed
- It should be stated between the dates of the study
- Preclinical and clinical years should be defined
- The author did not provide information regarding the calculation of sample size
- The statistical approaches included in the methodology were not stated clearly by the author
- Results should be written in more detail
