Potential competing interests: No potential competing interests to declare.

Here is a useful reference arguing for the climate researcher as (interdisciplinary) 'general practitioner': Susan L. Brantley, 'The Critical Zone Paradigm—A Personal View', in Latour and Weibel, *Critical Zones*, pp. 140-141. In that large book, there is also much discussion of 'critical zone observatories', which also relates to this article. The RSGIS, it could be argued, is an improvement on the idea of the 'critical zone observatory'.

I'm not sure that calling scientists 'woke' is wise. There is so much negative debate around this term, and it is not really needed. If you want to use it, then I would make a case for it.

fig 3 is hard to read.
