Potential competing interests: No potential competing interests to declare.

The work is interesting but very preliminary.

Authors should identify the bioactive component and evaluate the activity of the pure compound.

Why have the authors only evaluated antioxidant activity?

Authors must screen the plant for other biological activities such as anticancer, antidiabetic, antimicrobial activity, etc.

For metabolite profiling, they must go for HRMS/MS analysis of extracts.

For antioxidant activity, the extracts were dissolved in which solvent? Not mentioned in the manuscript.
