¹ Institut National de Recherche en Génie Rural, Eaux et Forêts (INRGREF)

Potential competing interests: No potential competing interests to declare.

Strengths - Reporting on methods combined with the social exchange theory to explore the factors that drive cooperative behaviors for effective water conservation.

- In general the language and the presentation of the study is good

- **Weaknesses:**

The manuscript is rather a report that describes specific methods. It does not have a finding section.

Suggestions:

- The main scientific objective needs to be defined. It can't be only documentary research. The latter is part of any scientific work.
- It's important to emphasize on the new knowledge provided by the study. This is not clear within the manuscript
- Structure of the paper needs to be balanced. The manuscript shows about 20% of introduction, more than 50% of methods and 15% of discussion and conclusion
- It's crucial to add a result section
