Potential competing interests: No potential competing interests to declare.

1. Please consider making a new appropriate title. The content of the manuscript is more about the interaction of bioactive compounds from cinnamon on the various signalling pathways. The two terms, prevention and progression, are not suitable.
2. The scientific name of cinnamon should be mentioned, probably in the title and once in the introduction.
3. Is NF-B the same as NF-kappaB?
4. Please provide keywords.
5. Please provide a graphical abstract.
6. There is no table of figures in this manuscript. Please make a table of bioactive compounds from cinnamon extract. Please specify part of the plant, solvent used. The authors can focus on the major compounds. Please make several chemical structures of the major bioactive compounds. If possible, photos of the plant are also good.
7. Please make a table for the signaling pathways that are under the influence of cinnamon extract/bioactive compounds.
8. The title "Potential Mechanisms of Action" is not appropriate since the content is about signalling pathways. My suggestion is "The interaction of bioactive compounds from cinnamon with several signalling pathways."
9. The title "Cancer Prevention" is not correct. The content is about gut microbiota and inflammation, which is too narrow for the term "cancer prevention." Furthermore, the contents are too short and not deep enough.
10. The coherence and cohesiveness from the title, objectives, and titles of every session need to be rewritten properly.
