Covid Nerve Injuries

Clarifying several issues would help the reader apply the conclusions of this report in their own patient populations

1. Clarify how many of the patients required ventilation and of those how long the ventilatory support was. This could be shown in the table.
2. Did any of these patients also have critical illness neuropathy / myopathy
3. When were the peripheral nerve lesions discovered? Was this during the acute hospitalization versus when the patients were in rehab. This could also be shown in the table.
4. How were sciatic lesions diagnosed versus peroneal.
5. Were the median lesions distal or proximal. The same question for the radial lesions.
6. Clarify that the weight of the pressure device was 4 gm rather than the smart phone.
7. The role of elbow position in the etiology of ulnar lesions needs to be considered along with the local elbow pressure values you present.
