First of all I would like to congratulate the author. The manuscript is well written, clear and relevant.

Despite the fact that Mathematical models to know what happened with COVID -19 pandemic could be seen as irrelevant now, I think this approach could help predict scenarios in future Global Health Crises.

I just wonder what is the population age distribution in Mauritius, if the age was adjusted in the model and if the fact that the island is mainly a tourism destination, if that could have had an influence on the number of cases (maybe they receive a lot of retired tourists?)
