This is a nice, divulgative rather a scientific paper on anti-viral immunity. The general observations are then applied to SARS-CoV2. The description of germinal center reaction and thymic T-cell selection is a bit superficial, but if the aim is to reach a broader basic population, it's fine. The core of the paper, the 8 categories, is a nice hypothesis but, as such, has to be presented in the text and in the title. Non-expert may think it's a documented pattern (which is not).
