Potential competing interests: No potential competing interests to declare.

Overall, this article is technically sound. However, there are some comments:

Abstract should provide an overview of research questions, summarize the significant findings, and conclude the paper. Besides, the model of the machine used in this paper should be removed from the abstract.

Introduction is too lengthy and lacks a clear motivation.

Materials and methods: This section should include a concise description of the materials, procedures, including how the study was conducted. Not introduction repeated again in this section.

Results and discussion: You need to support your results by providing more explanation and why they matter. The authors should analyze the results in the context of supporting literature and existing knowledge to support your hypothesis. Besides, lacking some analyses. For example, the morphology of the fractured surface of the specimens. It would be nice if the authors could provide a comparison before and after the tensile test.

Novelty is an important aspect of the research. However, I couldn't find any new methodology or new observation that leads to the acquisition of new knowledge.
