The article is just like an essay, with the title "Examining the Impact of Green Finance on Carbon Emissions in India through Energy Consumption Optimization," not a research article. The results and the conclusions seem to be claims without statistical proof.

1. The introduction is too long. The research objectives should be plausible, and the authors should be able to guide the readers on how the authors performed the method to achieve the objectives.
2. The authors need to state clearly the research gap and the novelty of the research.
3. The concepts of green finance, carbon emissions, and energy consumption optimization should be explained and measured.
4. Research methods should be narrated clearly, including the research model, the variable measurements, and the data analyses.
5. Accordingly, the statistical results should be provided and analyzed to provide evidence that Green Finance affects Carbon Emissions in India through Energy Consumption Optimization.
6. The authors should ensure that all objectives of the research have been accomplished. Furthermore, the promised contribution should be clearly proven through statistical examination.
