Thanks for sharing this paper. Here are my comments

The first important thing, what we focused on? I think we should focused on nitrogen treatments, although genotype played important roles in wheat quality indices (see the F-values of ANOVA). So I suggested to show our aims in the introduction.

and other minor comments

1. what is the traditional nitrogen rate in local area? 40 kg/ha or 120 kg/ha?
2. this experiment was carried only in one-year, thus there were probably soil provided much of nitrogen to the plants, so no significant differences were found in this study.
