Potential competing interests: No potential competing interests to declare.

Overall, the text is informative and highlights the global health concern posed by dental infections. However, there is a lack of specificity regarding the recommended alternative treatments for non-bacterial infections, as mentioned in paragraph 9. Providing specific examples or elaborating on alternative treatment options for such infections could enhance the clarity of this information.

Moreover, the text discusses the prevalence of dental infections in both developed and developing countries. While the information is insightful, it would be beneficial to include recent statistics or research findings to support the claims made about the prevalence of dental caries and periodontal diseases in different regions.

Additionally, the discussion on antibiotic resistance could be strengthened by providing more details on the mechanisms of resistance and potential consequences for public health. This could involve delving deeper into the molecular aspects of antibiotic resistance and explaining how it occurs at the bacterial level.

Lastly, the text would benefit from a clearer structure, possibly using subheadings to organize the information more effectively. For instance, dividing the content into sections such as "Introduction," "Dental Infections and Antibiotics," "Epidemiology," "Common Bacteria," and "Antibiotic Resistance" could improve readability and accessibility.
