Potential competing interests: No potential competing interests to declare.

The paper presents a viewpoint based on a model of the mind of the observer. In the model, an observer might be limited to keep enough variables in mind. So how 'enough' is enough? Is this the problem of dealing with parameters?

To me, it appears that certain definitions are undefined. For example, the notion of accessible and inaccessible variables. I think these need not to be defined formally.

Additionally, the author has talked about communicating observers. I think the kind of communication among the observers should be defined.
