Potential competing interests: No potential competing interests to declare.

Overall, paper quality is good, but the write-up needs to be improved. Authors can try some new AI models (such as Cascade R-CNN, Detectron2, Single Shot MultiBox Detector, EfficientDet Mask R-CNN, etc.) for comparing the results. References must be properly assigned as multiple references are often assigned together. The abstract and conclusion must be reframed properly. The literature review must be written author-wise, and a summary of related works must be specified. In the results and experimentation section, it must be compared with other researchers' work.
