Pancuronium Bromide

National Cancer Institute

Source

National Cancer Institute. *Pancuronium Bromide*. NCI Thesaurus. Code C47651.

The bromide salt form of pancuronium, a synthetic, long-acting ammonio steroid muscle relaxant with curarimimetic, some antimuscarinic and sympathomimetic effects.

Pancuronium bromide competitively binds to the nicotinic receptor at the neuromuscular junction, thereby preventing acetylcholine binding and resulting in skeletal muscle relaxation and paralysis.
