Potential competing interests: No potential competing interests to declare.

The paper addresses a set of current and relevant topics, with emphasis on the descriptive and analytical dimensions. There are also proposals on how neuroeconomics can contribute in decision-making scenarios. The neuroeconomics perspective is presented as an alternative to the mainstream view. The final part of the article, aimed at analyzing the particular situation in Russia, directs the discussion to the reality of a local economy. I suggest that the author undertake comparative analyzes in future researchs. An analysis of Russia's situation compared to another Brics member country, such as Brazil for example.
