

Review of: "Infodynamics, a Review"

Svetomir Simonović

Potential competing interests: No potential competing interests to declare.

The main strength of the paper is its interdisciplinarity, very broad scope of considered information facets, practical methods of information content estimations, and originality of introduced definitions of information-deduced terms. As far as I know, all considerations and terms are thoroughly based on contemporary science. The paper could be a good basis for developing the contained ideas into full-fledged articles or an interesting book. So I recommend it to the attention of readers and authors.
